

# OrBit User Guide

## Module 06: Deep IDE Presence & Flow State Gamification

PUBLIC DOCUMENTATION — FOR DEVELOPERS USERS

### 1 Overview

Software development is most effective when teams remain aware of each other's active focus areas without interrupting their concentration ("flow"). OrBit bridges desktop application state and your editor via **Deep IDE Presence** and **Flow State Gamification**.

### 2 The Floating Overlay HUD Hotkeys

OrBit includes a floating HUD overlay window designed for quick access without context switching:

- **Global Hotkey:** Press **Ctrl+Shift+P** (or **Cmd+Shift+P** on macOS) anywhere on your system to toggle the OrBit Overlay HUD widget.
- **System Tray:** Right-click the OrBit tray icon to open or resize the overlay widget.
- **HUD Capabilities:** Trigger P2P Pushes, inspect live daemon activity logs, view active teammates, and monitor flow state streaks.

### 3 Deep IDE Presence (VS Code Integration)

The OrBit VS Code extension connects to the local Rust daemon via an Axum WebSocket server running on `ws://127.0.0.1:65337/ws`.

#### 3.1 Real-Time Inline Teammate Cursors

When a teammate opens a file that you are currently editing in VS Code:

1. The teammate's editor reports their active document path and selection line number to their local daemon.

2. The daemon broadcasts the presence event to your machine over P2P.
3. Your VS Code extension renders a visual inline badge directly next to their cursor line:

```
14: export function calculateMetrics(data: Payload) {  
15:     const total = data.items.reduce((acc, x) => acc + x, 0);  
    Teammate (Alex) is here  
16:     return total / data.items.length;  
17: }
```

### 3.2 Pre-emptive Conflict Warnings

If you open or begin typing in a file where another teammate is actively working, the VS Code extension displays a warning toast:

**Pre-emptive Conflict Warning: Peer 7f8a3b is actively editing this file!**

This allows you to align with your teammate before unmergeable conflicts occur.

## 4 Flow State Gamification

To encourage deep, uninterrupted coding, OrBit includes a built-in **Flow State Engine**:

**Flow Heartbeat Monitoring:** The VS Code extension tracks typing velocity (keystrokes per minute) and save frequencies, transmitting metrics to **flow.rs** in the local daemon.

**Flow Threshold:** When a developer sustains steady coding velocity without distraction for 10+ minutes, the daemon triggers a **flow\_state** event.

**Gamification Badges & Streaks:** Sustained flow states earn streak points displayed on team leaderboards in the OrBit Desktop Client.
